"If this software was not available it would have been very difficult to automate drafting and design," says Christoph Rößler, a German inventor and entrepreneur, founder of Autodesk (which was bought by Apple in 2016) and former president of the software company Swissbit AG. "Since before the 1980s many companies have tried to do this with difficult and expensive software. The problem with CAD was that it was not available and it could not be used for less than a hundred grand." Today it's possible to get autocad access for around $250/year (less with a subscription), although most people probably get it free with a cheapo laptop. Few people know what an autocad file looks like, and of those that do, many don't know what to do with them. This is all about to change. Why is this post about autocad? Autocad is the most used software for architectural and mechanical drafting in the world, and it's free! Everyone has it. Everyone uses it. Some of us may even be very good at it. But nobody has a clue what it does. If you want to draw a building, or do mechanical or architectural drafting you probably just use it and it does what it does. Many people are starting to realise that design and drafting can be done with just a pencil and paper. It doesn't need to be complicated. But what about CAD software? Is it as easy as just drawing? Will it save you money and time? Can you make it work for you? Can you actually get paid for what you do? Can you do good, simple drafting and design? I think the answer to all of these

questions is yes, and also no, and it depends. The best thing you can do when looking for software is find the right software for you. Try out different programs, try to find what works for you. Perhaps you have an iPad, so perhaps there are programs there that will work for you. Maybe you've got a Windows machine at home and a Linux machine at work and you'd like to use the same programs there. Perhaps there is a program that can run on both. You could try that out. Perhaps your family has a Mac laptop and you could try a Linux app on that. For most of us, one computer is just not
